Weaving and knitting are the two primary textile processes for manufacturing fabrics. In the modern textile industry, these processes take place on electrically powered automated machines, and the resulting fabrics find their way into a wide range of end-uses, including wearing apparel, home furnishings and industrial applications. The weaving process consists of interlacing straight yarns at right angles to one another. It is the oldest technology of manufacturing fabric: hand-powered looms were used in pre-Biblical times. The basic concept of interlacing the yarns is still followed today.
